

A Picture's Worth...
Digital Image Analysis

Dr. Neal Krawetz
Hacker Factor Solutions
www.hackerfactor.com

Contents

- Digital Image Analysis
 - Problem Space
 - Analysis Methods
- Accuracy and Limitations
- Case Study
- Conclusion

All images and screen shots are copyright by their respective owners and are included for academic discussion and research. This complies with the copyright law of the United States as defined and stipulated under Title 17 U. S. Code. The methods presented here are experimental.

Digital Image Analysis Problem Space

Pictures Have Power

Space Shuttle Challenger

Iwo Jima, World War II

<http://grin.hq.nasa.gov/IMAGES/SMALL/GPN-2004-00012.jpg>
<http://www.archives.gov/publications/prologue/2004/winter/top-images.html>
<http://funny-insurance.blogspot.com/2007/05/top-10-best-funny-photo-of-funny.html>

Not All Pictures Are Real

- Why not real?
 - Modified to influence opinions
 - Enhanced to convey a point
 - Designed to show techniques
- Implications
 - Legal: Child Pornography vs. Virtual Child Porn
 - Security: Image as Authentication
 - Media: Misleading Headlines

Not legal advice!
I am not a lawyer!

Images and the Law

- Pornography
 - Protected by the First Amendment
- Child Pornography
 - Child Pornography Prevention Act (1996)
 - Prevents use of children in sexually explicit materials
 - Does not distinguish real from fake
- Virtual Child Pornography
 - Ashcroft v. Free Speech Coalition, 535 U.S. 234 (2002)
 - CPPA violated free speech rights
 - Distinction between “CP” and “VCP”
 - VCP does not use real children (it is regular “pornography”)

Images as Authentication

- How do you authenticate someone online?
 - Name, Address, Phone, Age
 - Collecting information from minors...
- Forging authentication
 - Yahoo!
 - Myspace

Yahoo! Impersonation

Date: Fri, 20 Apr 2007 12:38:13 -0700
Subject: Re: Abuse - Impersonation
Reply-To: Yahoo! Mail <mail-abuse@cc.yahoo-inc.com>

Hello,

Thank you for contacting Yahoo! Customer Care.

If you are an individual being impersonated by a Yahoo! Mail user, we will need a signed statement from you denying any involvement with the account, as well as a copy of the email (including full Internet headers) that is going out in your name. If you do not have an actual email message, please give us a detailed explanation of why you believe you are being impersonated. We will also need **a copy of your photo ID**.

If your company is being impersonated by a Yahoo! Mail account, we will need a signed statement on company letterhead denying any involvement with the account, as well as a copy of the email (including full Internet headers) that is going out with the company name.

You may **fax** your statement to us at:

(503) 615-3883

Defeating Yahoo Identification

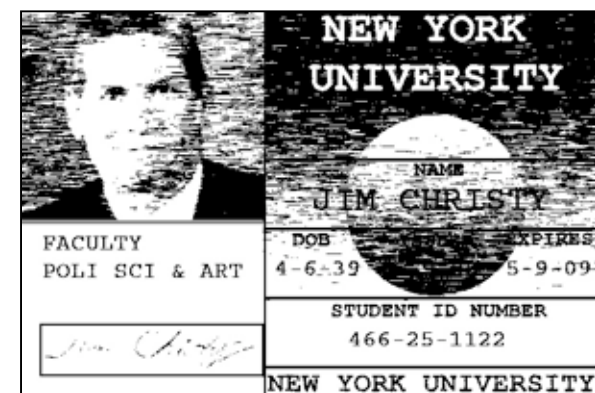

- Fake Photo ID
 - Download template <http://www.linkbase.org/make-fake-id/>

- Photoshop

- Fax!

Images as Authentication

The image shows a screenshot of a MySpace FAQ page. The browser address bar displays the URL: <http://www.myspace.com/index.cfm?fuseaction=misc.faq&Category=36&Question=26>. The page title is "Someone is pretending to be me - what do I do?". The main heading is "Someone is pretending to be me - what do I do?". Below the heading, the text reads "Solution:" followed by "In order to verify your identity, please send us a 'salute':". A list of instructions follows:

- This means we will need an image of yourself holding a handwritten sign with the word "MySpace.com" and your Friend ID (your Friend ID number appears immediately after "friendID=" in the web address/URL when viewing your profile). We can then remove the profile that uses your identity without your permission.
- Please be sure to include the web address/URL to the profile in question when you send your salute.
- If the profile is an extremely obvious attempt to be cruel/false, you may not need to send a salute. Sending a salute will help expedite things, though!
- Contact us [here](#).

An inset photograph shows a man in a white checkered shirt holding a white sign that reads "WELCOME TO THE HALL OF SHAME".

419eater.com

My Problem with MySpace

<http://www.peacexpeace.org/elements/images/familysinguy.jfif>

Fake Photos in the Media

- Old School
 - Staged
 - Mislabeled
 - *Not detectable*
- Old-tech
 - Negative splicing
 - Airbrushing
 - *May be detectable*
- Hi-tech
 - Digitally spliced
 - Digitally enhanced
 - “Shopped”
 - *Is detectable!*

Old-School Fakes

10-Oct-1914: "I opened up the paper and what was my surprise to see a big spread picture of myself, lined up against that row of Melle cottages and being shot for the delectation of the British public."

Adnan Hajj:
Beirut (Reuters)
22 July 2006
5 August 2006

http://www.greatwardifferent.com/Great_War/Belgium/Belgium_War_Reporters_01.htm

<http://neveryetmelted.com/?cat=743>

Copyright 2007-2008 Hacker Factor

Old and New

- Problem
 - Photos are REAL
 - Only identified by close inspection or tracking source
- Combined with new methods

2002 Dust Storm

2004 Tsunami

<http://www.snopes.com/photos/tsunami/sumatra.asp>

Copyright 2007-2008 Hacker Factor

The Big Questions

- Distinguish “real” from computer graphics
- How to detect image manipulations
- How to pull out information from images
 - Real images: who, where, when, how
 - Digitally enhanced: what, how
 - Computer graphics: what, how

The Big Answers

- Observation
- Basic Image Enhancements
 - Color Tweaking
- Image Format Analysis
 - Meta Data Analysis
 - Quantization Table Fingerprinting
 - Estimated Compression Level
- Advanced Image Analysis
 - Error Level Analysis (ELA)
 - Principle Component Analysis (PCA)
 - Wavelet Transformations
 - Luminance Gradient (LG)

Observation

Warez Factory

Warez F

Scaled, sharpened,
enhanced

Things to Look For

- Time
 - Clocks, calendars
 - Dated materials
- Location
 - Language
 - Region-specific technology
 - Currency and Electrical Outlets!
- Other
 - What's on the computer screen?
 - Any other identifiable elements

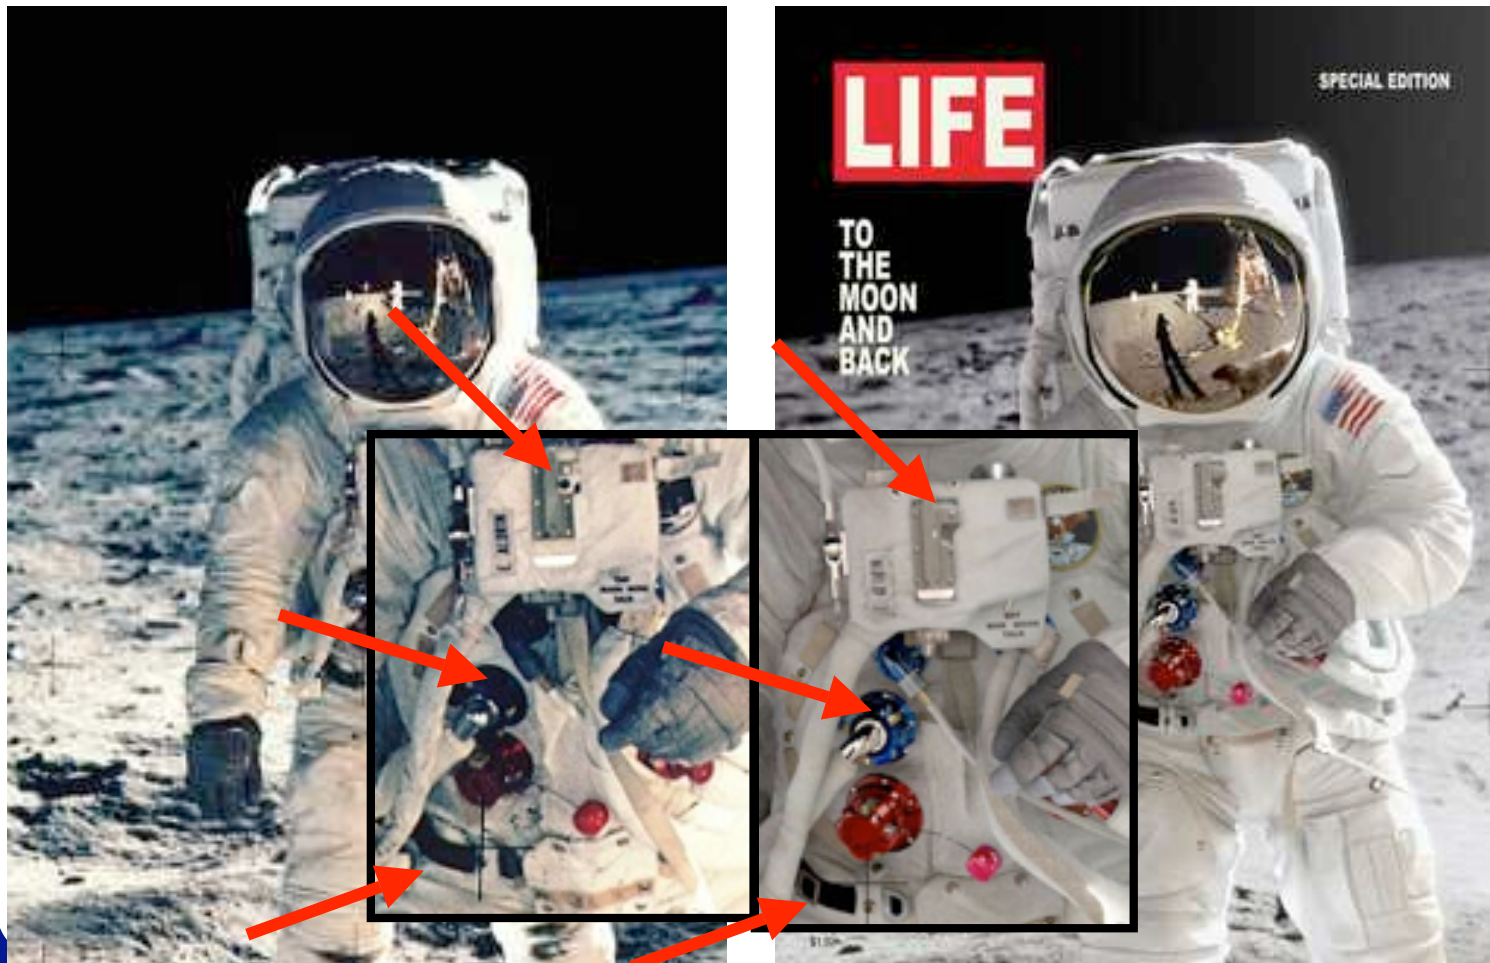

Example: Buzz

- Andrea Bertaccini
 - www.tredistudio.com
 - “CG Choice Award” from CG Society, 2006
- Says based on NASA photo
<http://www.hq.nasa.gov/office/pao/History/ap11ann/kippsphotos/5903.jpg>

Example: Buzz Compare

IMAX: *Magnificent Desolation*

- IMAX recreated moonwalk
 - <http://www.imax.com/magnificentdesolation>
 - Director: Tom Hanks
- Timeframe
 - Movie in 2005
 - Artist image in 2006

IMAX: *Magnificent Desolation*

What Happened?

- Artist likely:
 - Modeled position after NASA
 - Modeled spacesuit after IMAX

Format Analysis

Image Format Analysis

- Formats *are* information
 - Formats are data that contain data
 - Changes to image yield changes to format
- JPEG as an example
 - Most methods work with any image format

JPEG Feature Set

- Key Features of JPEG
 - Meta data
 - Quantization matrix for lossy compression
 - Lossy data format
 - Divide image into 8x8 cells
 - JPEG artifacts are usually visible 8x8 cells
- Feature Detection
 - Feature leads to manipulation detection

JPEG Meta Data

- Information about image
 - Camera type and settings
 - Date and time
- Multiple images
 - Varying quality
 - Useful for distinguishing cameras
- Meta data problem:
 - Modified or inaccurate
 - Applications do not update meta data!
 - Photoshop keeps camera info (even if picture changes)
 - Photoshop does not log Photoshop changes

```

Quantization Fingerprinting

- Should compute optimal quantization tables
 - CPU intensive!
 - Slow user experience!
- Hard-coded quantization tables
 - Few systems actually generate Q tables
 - Digital cameras use different Q tables
 - Vary by make and model
 - Optimized for CCD, data size, manufacturer
 - Canon pictures look best on Canon printers (colors optimized)
 - Cannot just “copy over” Q tables
- Forensics
 - Match Q tables to application or camera
 - Media outlets: Pay attention!

Quantization Quality

- What if Q tables not known?
- JPEG uses a quality value
 - Save at 95%, 80%, 65%...
 - Quality corresponds with size
- Quality not saved in JPEG!
 - Fingerprint Q table? Know tool and quality
 - Unknown Q table? Need to determine quality
- Derive quality value!

Quantization Tables

- Q tables: compression and quality
- Two tables for YCrCb
 - 1 for luminance (Y)
 - 1 for both Cr and Cb
 - Optional:
 - 3 tables: Y, Cr, and Cb
- 64 elements
 - 1st element = DC
 - 63 elements = AC
 - Compression by frequency

#	# Quantization table							
#	Table index=0 (luminance)							
	3	2	2	3	2	2	3	3
	3	3	4	3	3	4	5	8
	5	5	4	4	5	10	7	7
	6	8	12	10	12	12	11	10
	11	11	13	14	18	16	13	14
	17	14	11	11	16	22	16	17
	19	20	21	21	21	12	15	23
	24	22	20	24	18	20	21	20

#	# Quantization table							
#	Table index=1 (chrominance)							
	3	4	4	5	4	5	9	5
	5	9	20	13	11	13	20	20
	20	20	20	20	20	20	20	20
	20	20	20	20	20	20	20	20
	20	20	20	20	20	20	20	20
	20	20	20	20	20	20	20	20
	20	20	20	20	20	20	20	20
	20	20	20	20	20	20	20	20

Example Derivation

- Average AC values
 - Table 0: 11.63
 - Table 1: 17.57
- Average Y, Cr, Cb
 $(11.63 + 17.57 + 17.57) / 3 = 15.59$
- Get RGB/YCrCb conversion
 $||17.57 - 11.63|| = 5.94$ convert
- Combine to find quality
 $100.0 - 15.59 + 5.94 = 90.35\%$
Call it 90%

See jpegquality.c

Quantization table

Table index=0 (luminance)

3	2	2	3	2	2	3	3
3	3	4	3	3	4	5	8
5	5	4	4	5	10	7	7
6	8	12	10	12	12	11	10
11	11	13	14	18	16	13	14
17	14	11	11	16	22	16	17
19	20	21	21	21	12	15	23
24	22	20	24	18	20	21	20

Quantization table

Table index=1 (chrominance)

3	4	4	5	4	5	9	5
5	9	20	13	11	13	20	20
20	20	20	20	20	20	20	20
20	20	20	20	20	20	20	20
20	20	20	20	20	20	20	20
20	20	20	20	20	20	20	20
20	20	20	20	20	20	20	20
20	20	20	20	20	20	20	20

Quantifiable Problem

- Data loss is cumulative
- Resave problem:
 - Save an image at quality of 75%
 - Resave image at 90%
 - Image does *not* get better!
 - $90\% \text{ of } 75\% = 67.5\%$
 - Quantization tables reflect 90%, not 75% or 67.5%
- How to detect image resaves?
 - Principal Component Analysis!

Principal Component Analysis

- PCA separates info
 - Computer vision
 - Data compression
- Identifies widest variance among points
 - 3D = 3 components
 - PC1 = widest
 - PC2 = next widest
 - PC3 = narrowest

PCA Example

PCA Example

PC1 with Artifacts

95%
90%
80%
70%
60%
50%

PCA Mixing: 90% with 75%

PCA Mixing: 90% with 75%

Example: Back to the Moon

Buzz Aldrin Moon Walk

- “All the image are made in 3DS MAX and postprocessed in Combustion and Photoshop.”

<http://forums.cgsociety.org/showthread.php?t=323480>

- JPEG Q tables say:
 - Photoshop
 - 89% quality

Buzz Aldrin Moon Walk

Walk

Error Level Methodology

- JPEG is lossy format
- Each resave introduces more error
 - But “copy” does not
- Error rate not linear!

Error Level Analysis

- Each 8x8 cell should be at same quality level
- Changes to image change quality level for the 8x8 cell

Methodology

- Save image at 95%
 - Intentionally introduce known error rate
- Compare original and new 95% image
- Difference = error state
 - No difference = image local minima
 - Large difference = unstable 8x8 cell = original pixels!

Error Rate Example

Original

Resave #1, 75%

Resave #2, 75%

Modification Detection

Resave #1, 75%

Wavelet Transformations

- Problem:
 - If quality is same, how can you find differences?
 - How to identify layers?
- Solution?
 - WAVELETS!

Wavelet Limitations

- Any signal can be approximated
- Some signals more difficult than others
 - Square waves or sharp color changes
 - Smooth, linear transitions
 - Extreme values (black or white)
- Some signals easier to approximate
 - “Natural” colors
 - Noisy images (e.g., CCDs)

Wavelet Image Analysis

- An 800x600 picture has 480,000 wavelets
 - Render only a few % to get general picture
 - Picture will appear blurry
 - Entire image should sharpen at same rate
- Image modification detection
 - Scaled images sharpen at different rates
 - Images from different focal lengths sharpen at different rates
 - Why? Images have different signal patterns

Wavelet Example

Analysis Limitations

- Small Images
 - Wavelets fail
- Scaled Images
- Low Quality
 - Image Corruption
 - GIF and limited-color images
- Wavelets and harmonics
- Mixing Media
 - From Photo to Magazine to JPEG...
- Extremely Talented Artists (rare)

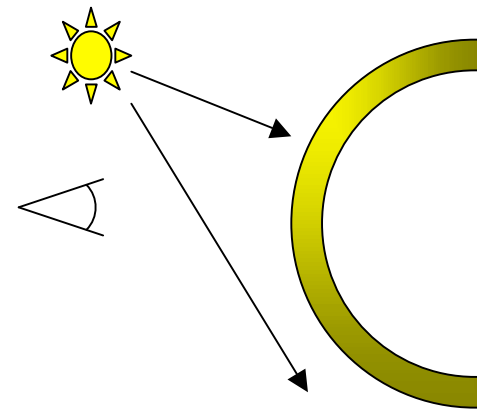

Luminance Gradient

- Original plan: detect lights and direction
 - Turns out: the algorithm sucks.
 - Identifies general direction, but not specific
- The Power of LG
 - Distinguish CG from Real, manipulations
 - Vastly different light sources implies splicing
 - Edge and surface detection
 - Crisp edges, sharp curves, smooth gradients
 - Clean = computer graphics

LG Concept

- Lighting is never “even” (but coloring is)
 - Given an item with a uniform color...
 - Area closest to the light will be brightest

LG Algorithm

- Many many many variations

LG Arrows: Hands

LG Arrows: Hands

LG Arrows: Hands

Noise on picture

Noise around apple

No noise here

Noise here

From the Photographer...

- Photographer:

“This is Eric Cahan. I took the photos of rachael ray that appeared in FHM a few back [sic]. It’s just bad over retouching that FHM did but it’s her.”
- Photoshop: Magic wand and “Liquify”
- Other pictures not tampered as badly

Perfectly Imperfect

- Analysis Limitations
 - Image Quality
 - Algorithm Limitations
 - Humans...
- Overall Accuracy

Limitations: Quality

- Size Matters
 - Small images: Wavelets fail (use $> 300 \times 300$)
 - Very small images: ELA, PCA, LG fail
- Scaled Images
- Low Quality
 - Image corruption (resaves)
 - Limited-color (e.g., GIF or monochrome)
- Image coloring
 - High contrast
 - Specular reflections and “washed out” areas

Limitations: Algorithm

- Wavelets and harmonics
- ELA and color selection
- Complex lighting and LG
- Mixing Media
 - From Photo to Magazine to JPEG...
 - Scanner, camera, video capture card

Limitations: Humans...

- Human Interpretation
 - Algorithms only highlight
 - Humans interpret
- Extremely Talented Artists (rare)
 - Most people already have the tools
 - Better tools can be purchased
 - Few people have the skill

Method Accuracy

- DoD Cyber Crime Center (DC3)
 - Blind test: “Real or CG?”
 - 51 images
 - 6 were “unknown” to the DC3
- Results
 - 86% accurate for known images
 - 0 false-positives (no “real” called “CG”)
 - 4 of 6 false-negatives were CG Society award winners

Al-Zawahri: U.S. is talking to wrong people in Iraq

Updated 12/22/07 9:13 AM ET

CAIRO (AP) — Al-Zawahri, the leader of al-Qaida, is negotiating a deal with the U.S. in a video broadcast, talking to his captors.

"I want to tell you that you are trying to withdraw, and your attention is on the tape, on the bullets."

"It seems that you will go through a painful journey of failed negotiations until you will be forced to return to negotiate with the real powers," he said, without identifying these powers.

The video — which bore the logo of al-Qaida's media production house, al-Sahab — was the 15th time this year that al-Zawahri has sent out a statement. In Wednesday's tape, he appeared exactly as in previous videos that have been authenticated by CIA analysts. He wore a black turban and white robe and pointed his finger at the camera for emphasis. As usual, he had a rifle behind his right shoulder that was leaning against a plain brown backdrop.

“He wore a black turban and white robe ... he had a rifle behind his right shoulder that was leaning against a plain brown backdrop.”

Digital Osama Bin Laden?

Filed under: [Tech](#), [politics](#), [Art](#) — spence @ 3:07 pm

I just read [this little piece](#) about the Osama bin Laden tapes and you know, as I read his line about "It is a good thing most regular people don't have this kind of artistic skill." I thought to myself:

Imagine the buzz I could create:

- Build, texture and rig a completely believable Bin Laden model. -3 months
- Animate using Arabic phonemes. - 2-3 months
- Leak video to Al Jazeera - 1 day
- Eventually let it out that it's a hoax. - 1 day

Hello Gitmo. - forever.

2007 - 2nd segment

Camera Setting

ent

Recolor Image

2004

2007 - 2nd segment

Analysis Summary

- No indication of digital modification
- Align on eyes
 - Same eyes, eyebrows, nose, mouth, hairline
 - Shoulder position matches
 - Hat is worn higher
 - Desk and papers align
 - SAME ASPECT RATIO
 - Overall color of 2004 likely altered during post-processing
- Implies
 - Extremely similar setting, lighting, camera setup
 - Same person but with a different beard

What About the Beard

- Option #1: All recorded in 2004
- Option #2: Recreation

Beard Option #1

- Option 1: All video recorded in 2004
 - Similar set, lighting
 - Similar camera position and aspect ratio
 - Similar clothing & hairline
- Implies:
 - Dyed or costume beard
 - Gray beard is larger with dark edges
 - Gray is likely fake
 - Multiple recordings hours or days apart
 - 2007 audio is dubbed
 - No Bin Laden since 2004

Beard Option #2

- Option 2: Recreation
 - Recreated lighting and set (including papers)
 - Recreated camera position and aspect ratio
 - Match clothing, hairline
 - And all 3 years later!
- Implies:
 - Significance to the set
 - But the set is plain...
 - Forgot beard, robe...
 - Bin Laden dyed beard
 - Beard shrank in length

Which Option is Right?

- Cannot tell from image analysis
- Practical view: Occam's Razor
 - Simplest solution is likely correct.
 - Which is simpler?
 - Recording all video at once, and releasing over the years with audio-dubbed current events
 - Recreating the set, lighting and minutia but forgetting the big things

Conclusion

Need for Image Analysis

- Real versus Computer Generated
- If Modified, How?
- Uses
 - Media: Reality vs Fiction
 - Legal: Child Pornography vs VCP
 - Authentication: Real vs Doctored

Methods Covered

- Observation
- Basic Image Enhancements
 - Color Tweaking
- Image Format Analysis
 - Meta Data Analysis
 - Quantization Table Fingerprinting
 - Estimated Compression Level
- Advanced Image Analysis
 - Error Level Analysis
 - Principle Component Analysis
 - Wavelet Transformations
 - Luminance Gradient

Other types of analysis:

Shadow Detection

Mixture of Gaussians

Minimum Variance Color Selection

Minimum Variance Quantization

K-Means

Scale-Invariant Feature Transform

Signal-to-Noise Ratio

Color Filter Array Detection

... and the list goes on ...

Where to Start?

Questions?

Shameless self-promotion.
